

Event Locator API Documentation

The Event Locator API is a robust and scalable solution designed to simplify event discovery and management. Built using Node.js, Express, Sequelize (PostgreSQL), and JWT-based authentication, this API enables users to:

Create and manage events with customizable categories

Discover events based on location, popularity, and user preferences

Interact with events through ratings, reviews, and RSVPs

Ensure security with token-based authentication and role-based access

With a focus on performance, scalability, and seamless user experience, this API is ideal for applications that require dynamic event listings.
